

## Midterm Project Commentary

### Diagram on the page 2

I decided to implement CSS styling using Bootstrap. Originally I wanted to do the user authentication, but, not going to lie, I run out of time, while I did styling along the way.

In order to implement it I followed the Bootstrap documentation and looked for tips on-line.

One thing I'm particularly happy about is handling the drafts. (Lines 117 – 216 in index.js) I did this as a last thing in the project and it really took some effort for me to implement it, especially that there are many different operations (DELETE, INSERT, SELECT and UPDATE) that for some functionality have to be run simultaneously. However I didn't fully implement UPDATING the draft as I run out of time. Another thing I'm really happy about is that I've made almost everything myself, based on the course lectures. There is only one script that my friend helped me with as I didn't know how to solve the problem of passing the article id to the endpoint. (it's marked in the code)

I also added creating a profile section to the home page, and search bar to find article by the keyword, but I didn't finish all the required functionality. Settings on Author's page is not working as well as updating the draft. As a result I don't have even one working functionality where the content is updated in the database.

Another thing I'm not very happy about is that I've put all the routing in the index.js file. My plan was to build the working app and then clean it up, but again, I run out of time.
